

Groundwater resources productivity

Significant groundwater resources

- High productive: Single wells mostly > 40 l/s, waterworks frequently > 5 million
- Productive: Single wells mostly 15 - 40 l/s, waterworks frequently 1 - 5 million
- Less or variable productive: Single wells mostly 5 - 15 l/s, waterworks frequently 0.2 - 1 million m³/a

Less significant groundwater resources

- Productivity of wells mostly < 5 l/s; locally in wells and springs high productivity possible; use restricted for technical and hygienic reasons

No significant groundwater resources

- Productivity of wells usually < 2 l/s; local wells can be important for water supply
